Randomness

is equivalent to

Differentiability

by Demuth, Pathak, Nies et al.

Then why?

The Lebesgue Differentiation Theorem is (a part of) an explanation.

My suggestion

Martin-Löf
randomness

Versions of integral
tests

Proof

Applications

More precisely ...

A way from randomness to differentiability

- pass a test,
- finite for an integral test,
- LDT holds for an integral test,
- differentiable for f s.t. f' is an integral test,
- their "difference" versions.

Applications

2^ω : Cantor space with the product topology

$[\sigma] = \{A \in 2^\omega : \sigma \preceq A\}$: base sets

μ : uniform (Lebesgue) measure

A *c.e.* open set is a union of a c.e. set of cylinders.

Definition 1. A Martin-Löf test (or *ML-test*) is a sequence

$\{U_n\}$ of uniformly *c.e.* open sets with $\mu(U_n) \leq 2^{-n}$.

A passes a *ML-test* if $A \notin \bigcap_n U_n$.

A Martin-Löf random if it passes all Martin-Löf tests.

Integral test

Main thesis

Martin-Löf
randomness

❖ Martin-Löf
randomness

❖ Integral test

❖ Differentiability

Versions of integral
tests

Proof

Applications

We identify 2^ω with $[0, 1]$.

Definition 2. $t : [0, 1] \rightarrow [0, +\infty]$ is c.e. if

$$\{x : q < t(x)\}$$

are c.e. open uniformly in $q \in \mathbb{Q}$.

t is called integral test if $\int_{[0,1]} t(x) dx \leq 1$.

Remark 3. We can replace $\int t(x) dx \leq 1$ with $\int t(x) dx < \infty$.

Proposition 4. TFAE:

- A real z is ML-random.
- $t(z) < \infty$ for all integral tests.

Differentiability

Main thesis

Martin-Löf
randomness

❖ Martin-Löf
randomness

❖ Integral test

❖ Differentiability

Versions of integral
tests

Proof

Applications

f is of *bounded variation* if

$$\sup \sum_{i=1}^n |f(t_{i+1}) - f(t_i)| < \infty$$

where $t_1 < t_2 < \dots < t_n$ in $[0, 1]$.

Theorem 5 (Demuth; Nies, Brattka and Miller). $z \in [0, 1]$ is *ML-random* \iff every comp. func. f of bounded variation is differentiable at z .

Relation btw. integral tests and differentiability?

Definition 6. generalized ML-test: $\{U_n\}$ of uniformly c.e. open sets with $\lim_n \mu(U_n) = 0$.

z is weakly 2-random if it passes all generalized ML-tests.

Theorem 7. TFAE:

- A real z is weakly 2-random.
- $t(z) < \infty$ for all c.e. functions t such that $t(x) < \infty$ a.e.
- $t(z) < \infty$ for all c.e. functions t such that $\int f \circ t(x) dx < \infty$ for some order function f .

Definition 9. Schnorr test: a ML-test s.t. $\mu(U_n)$ is computable uniformly in n , and $\lim_n \mu(U_n) = 0$.
 z is Schnorr random if it passes all Schnorr tests.

Theorem 10. TFAE:

- A real z is Schnorr random.
- $t(z) < \infty$ for all c.e. functions t such that $\int t(x)dx$ is computable.
