Preliminary

Randomness and Analysis

Preliminary Layerwise computability Schnorr layerwise computability Discussion

The topic is **layerwise computability**.

- In which field is the notion used?
 - (mainly) **Computable Analysis**
- Which field is needed to define the notion?
 - **Algorithmic Randomness**

It's puzzling, isn't it?

Cantor space

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Computability \Rightarrow Algorithmic Randomness

They interact with each other.

- Far from random iff close to computable.
- If already random, more random iff closer to computable.

It's called a **two-way interaction** by Nies.

Computable metric space

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Computability \iff Algorithmic Randomness

They are deeply connected.

Layerwise computability is the notion in computable analysis that is defined using the notion in algorithmic randomness!!

In this talk

Preliminary Layerwise computability Schnorr layerwise computability Discussion

I'd like to present you

- (i) how related computable analysis and algorithmic randomness are (in my point of view),
- (ii) why (Schnorr) layerwise computability is a natural notion

Overview of this talk

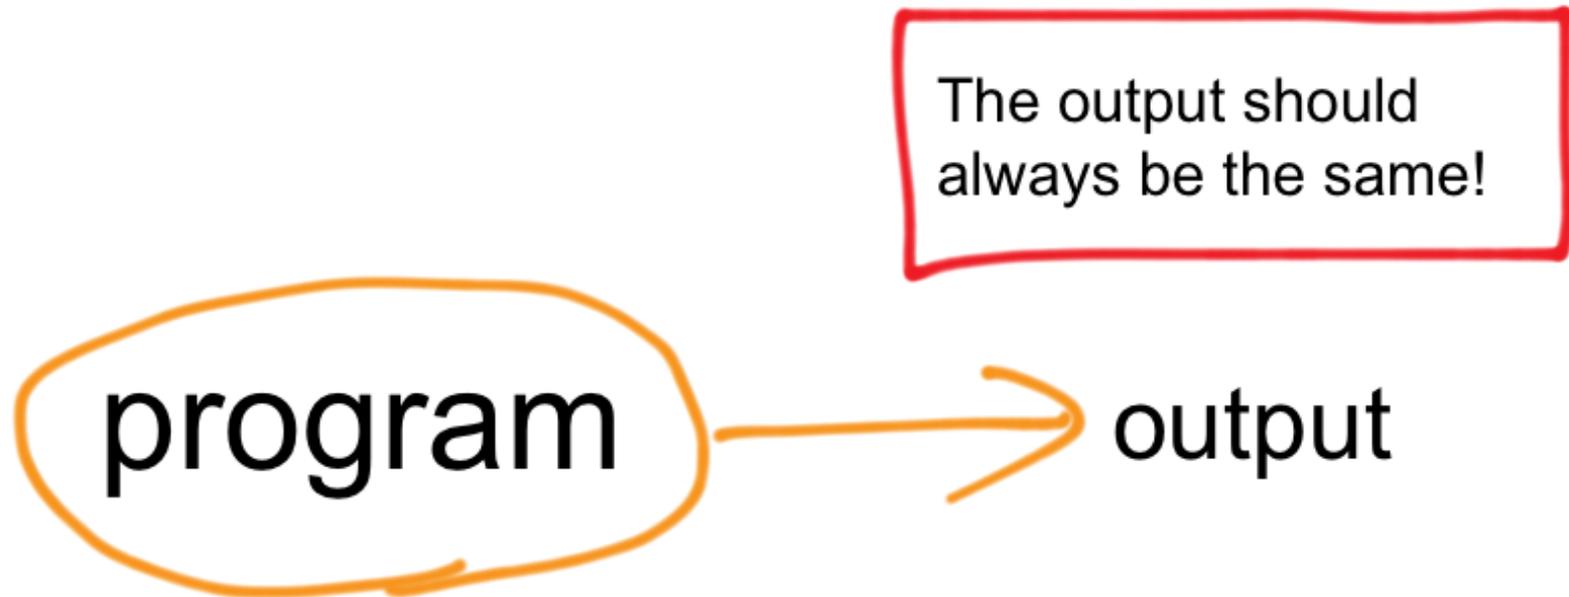

Preliminary Layerwise computability Schnorr layerwise computability Discussion

- algorithmic randomness and computable analysis
- layerwise computability
- Schnorr layerwise computability
- The reason layerwise computability may not be a natural notion

Layerwise computability

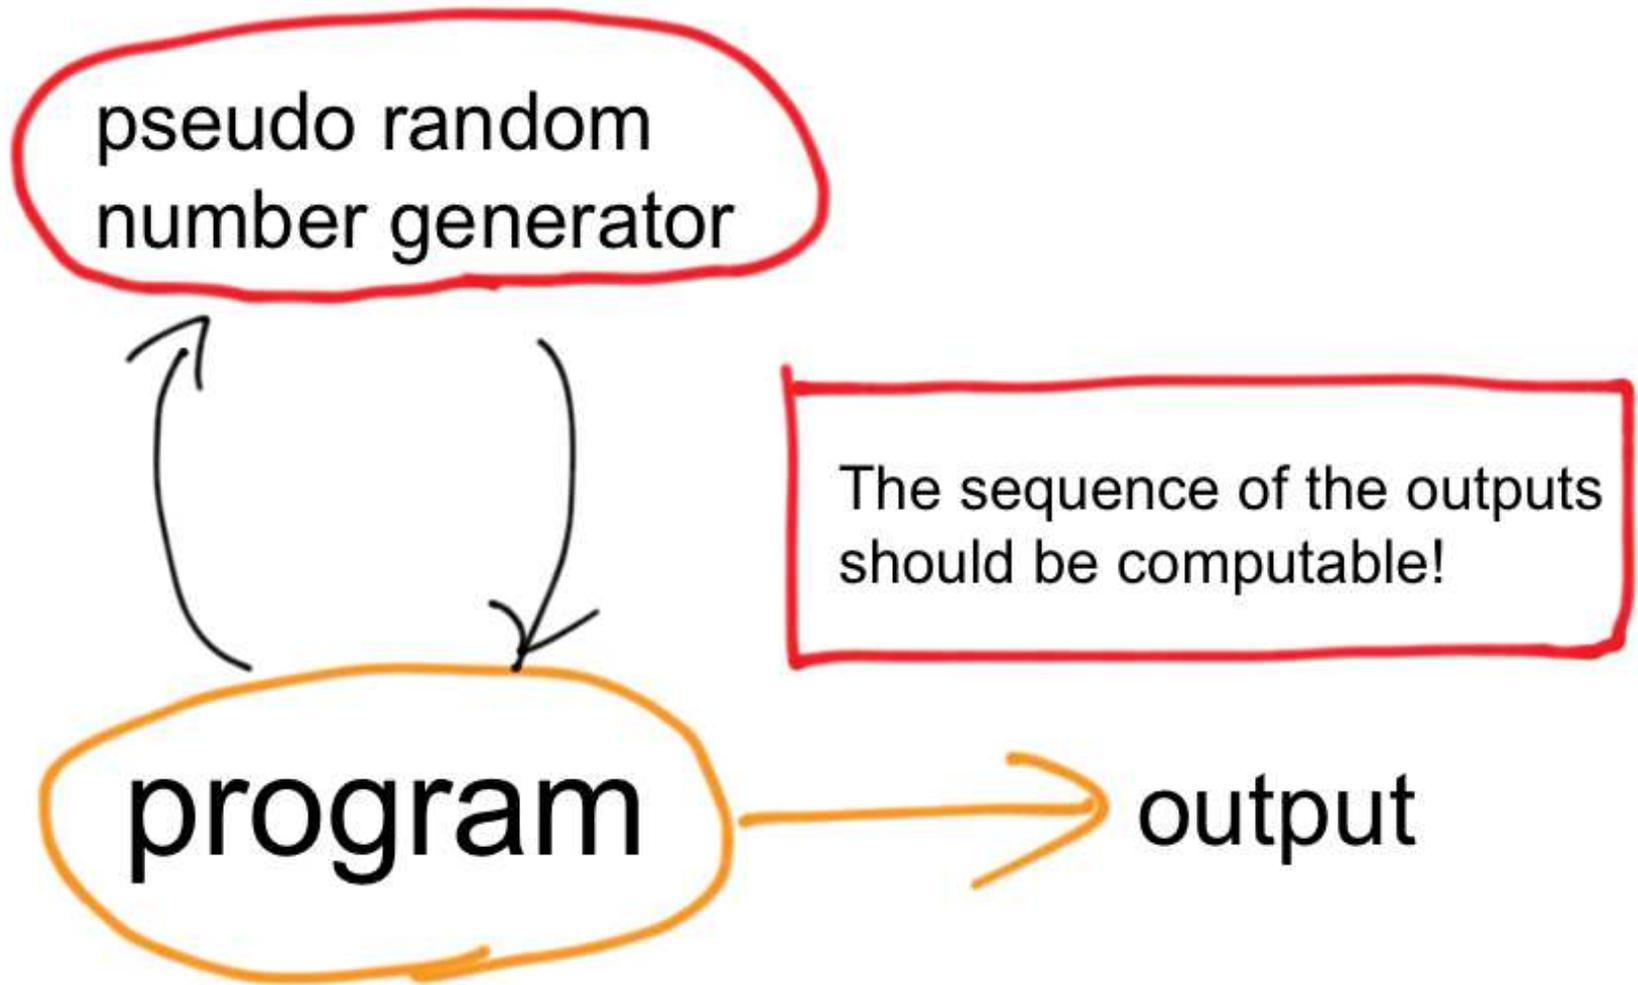

Example (1/3)

Example (3/3)

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Computability

Preliminary Layerwise computability Schnorr layerwise computability Discussion

- $[0, 1]$: unit interval
- A basic open set: (p, q) , $[0, q)$, $(p, 1]$ where $p, q \in \mathbb{Q} \cap [0, 1]$
- A open set U is c.e. if a c.e. union of basic open sets.
- Let μ be the Lebesgue measure, that is,
 $\mu((p, q)) = q - p$.
- A real in the unit interval is identified with its binary expansion.

Definition 1 (Martin-Löf (1966)).

- A *Martin-Löf test* (or *ML-test*) is a sequence $\{U_n\}$ of uniformly c.e. open sets with $\mu(U_n) \leq 2^{-n}$.
- A real x *passes* a ML-test $\{U_n\}$ if $x \notin \bigcap_n U_n$.
- A real x is *Martin-Löf random* (or *ML-random*) if x passes all ML-tests.

There exists an optimal ML-test $\{U_n\}$, that is, for each ML-test $\{V_n\}$ there exists d such that $V_{n+d} \subseteq U_n$.

Function defined a.e.

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Note that $0 = 0^\omega$ is not ML-random.

Consider the function $f : \subseteq [0, 1] \rightarrow \mathbb{N}$ such that

$$f(A) = \min\{n \mid A(n) = 1\}.$$

f is defined almost everywhere.

In particular f is defined for each ML-random point.

So it's natural to restrict the domain to random elements.

But it's just a partial computable function.

It's more natural to assume that f is not very large.

Let $S(n) = S_A(n) = \sum_{k=1}^n A(k)$ for $A \in 2^\omega$.

In probability theory

Theorem 2 (Strong Law of Large Numbers).

$$S(n) \rightarrow \frac{1}{2} \text{ with probability } 1.$$

In algorithmic randomness

Theorem 3 (Folklore).

$$S_A(n) \rightarrow \frac{1}{2} \text{ for each ML-random real } A.$$

Convergence speed

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Let $c(A)$ be the smallest c for which $A \notin U_c$.

Then there exists a computable function $n(c, \epsilon)$ such that

$$\left| \frac{S(n)}{n} - \frac{1}{2} \right| < \epsilon$$

for every $n > n(c, \epsilon)$.

For given $\lambda > 1$, there exists a computable function $n(c, \epsilon)$ such that

$$S(n) \leq \frac{n}{2} + \lambda \sqrt{\frac{n}{2} \ln \ln n}$$

for every $n > n(c, \epsilon)$. (Davie, 2001)

Interpretation

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Roughly speaking

the convergence speed is computable from its
randomness deficiency.

The class of such functions seems important.
Let's define it.

Computable function

Preliminary Layerwise computability Schnorr layerwise computability Discussion

A function $f : \subseteq 2^\omega \rightarrow 2^\omega$ is computable if it is computable by a Turing machine with one-way output tape.

A real x is identified with a sequence which encodes the set

$$\{(p, q) \mid x \in (p, q), p, q \in \mathbb{Q}\}.$$

Such a sequence is called a representation of the real.

A function $f : \subseteq [0, 1] \rightarrow \mathbb{R}$ is computable if there exists a computable mapping from a representation of a real x to a representation of $f(x)$.

Computable functions are always continuous!

Lower semicomputability

Preliminary Layerwise computability Schnorr layerwise computability Discussion

A function $f : [0, 1] \rightarrow \mathbb{R}$ is computable iff f^{-1} (basic open set) is uniformly c.e.

A function $f : [0, 1] \rightarrow \mathbb{R}^+$ is lower semicomputable iff $f^{-1}(> q)$ is uniformly c.e.

Roughly speaking a lower semicomputable function is a function approximated from below.

Layerwise computability

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Let $\{U_n\}$ be an optimal ML-test.

Let $X_n = X \setminus U_n$ where $X = [0, 1]$.

These sets are called **layers**.

Note that $\lim_n X_n$ is the set of ML-random points.

Definition 4 (Hoyrup and Rojas (2009a,b)).

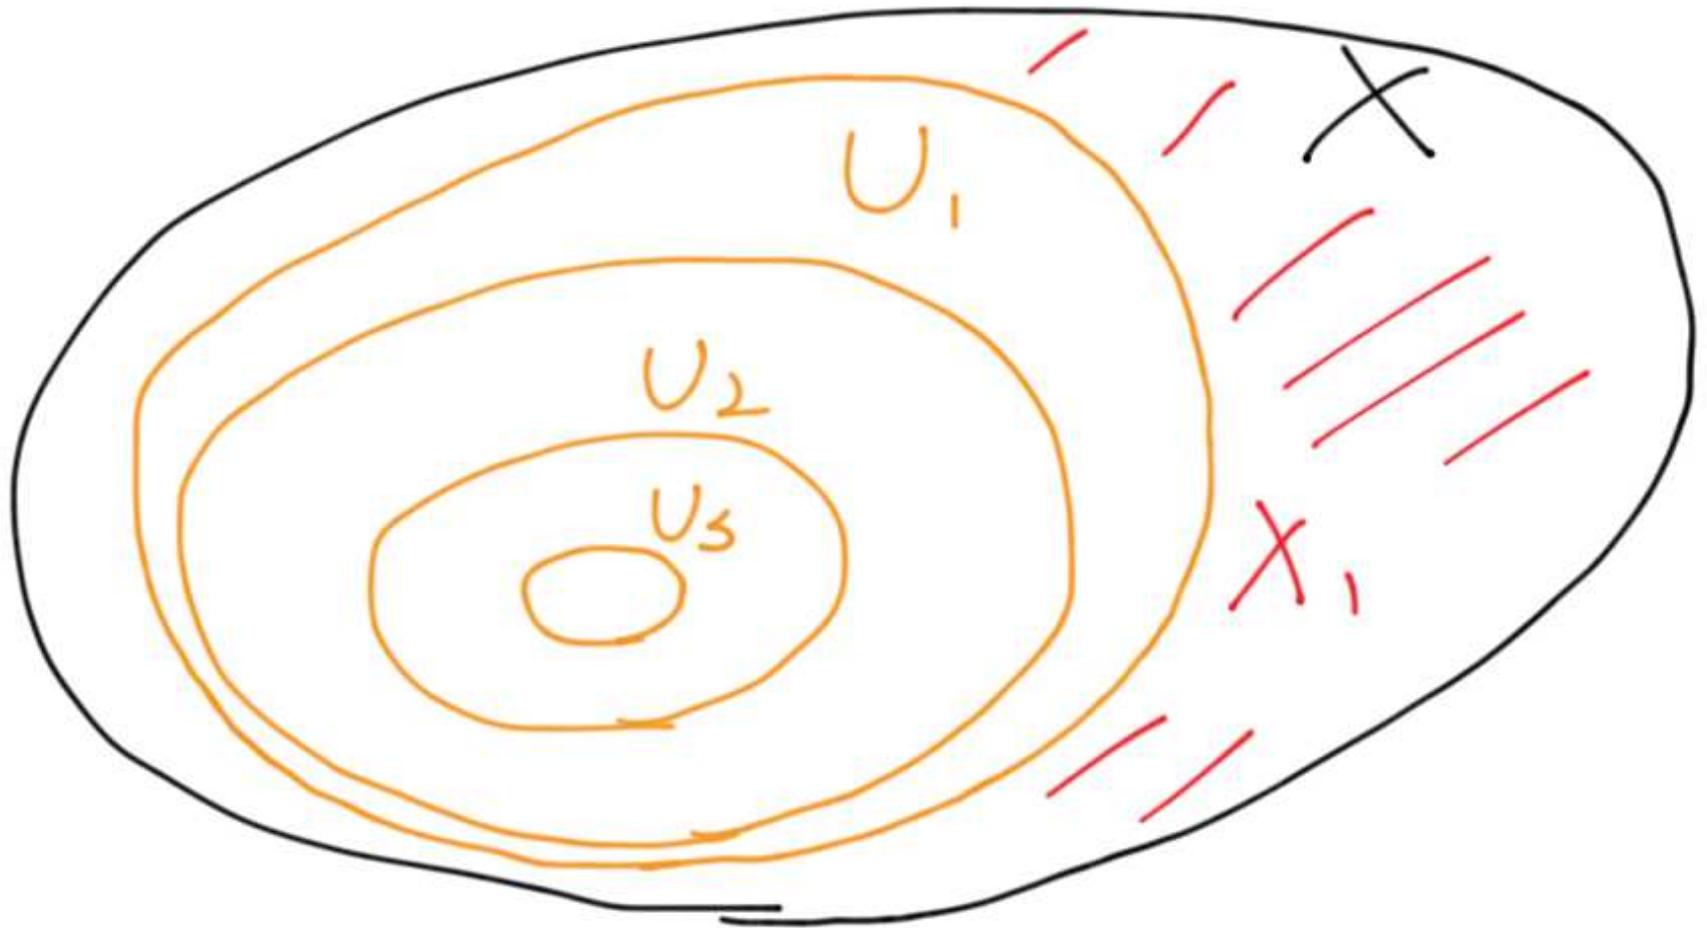

A function $f : \subseteq X \rightarrow \mathbb{R}^+$ is **layerwise lower semicomputable** if $f|_{X_n} : \subseteq X \rightarrow \mathbb{R}$ is uniformly lower semicomputable.

A function $f : \subseteq X \rightarrow \mathbb{R}$ is **layerwise computable** if $f|_{X_n} : \subseteq X \rightarrow \mathbb{R}$ is uniformly computable.

$A \mapsto \lim_n \frac{S_A(n)}{n}$ is layerwise computable.

Layer

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Basic properties

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Proposition 5 (Hoyrup and Rojas (2009a,b)).

If $f : X \rightarrow \mathbb{R}^+$ is bounded and layerwise computable, then $\int f d\mu$ is computable.

If $\int f d\mu$ is computable and f is layerwise lower semicomputable, then f is layerwise computable.

In general a layerwise computable function does not have a computable integration.

Which layerwise computable functions have computable integrations?

Schnorr layerwise computability

Integral test

A clue is found in a different research.

Definition 6 (Miyabe). An *integral test for Schnorr randomness* is a nonnegative lower semicomputable function that has a computable integration.

Theorem 7 (Miyabe). A point x is Schnorr random iff $t(x) < \infty$ for each integral test t for Schnorr randomness.

Note that an integral test for Schnorr randomness should be layerwise computable.

But it should have a relation with Schnorr randomness!!

Schnorr ver.

Definition 8 (Miyabe).

A function $f : \subseteq X \rightarrow \mathbb{R}$ is *Schnorr layerwise computable* if there exists a Schnorr test $\{U_n\}$ such that $f|_{X \setminus U_n} : \subseteq X \rightarrow \mathbb{R}$ is uniformly computable.

Note that ML-randomness \Rightarrow Schnorr randomness.

Schnorr layerwise computability \Rightarrow layerwise computability but the converse does not hold.

Properties

Preliminary Layerwise computability Schnorr layerwise computability Discussion

$A \mapsto \lim_n \frac{S_A(n)}{n}$ is Schnorr layerwise computable.

Theorem 9 (Miyabe).

If a function is bounded and Schnorr layerwise computable, then its integration is computable.

Coincidence

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Definition 10 (Miyabe).

Two functions $f, g : \subseteq X \rightarrow \mathbb{R}$ are Schnorr equivalent if $f(x) = g(x)$ for each Schnorr random point.

Theorem 11 (Miyabe).

A difference between two integral tests for Schnorr randomness is Schnorr layerwise computable.

A Schnorr layerwise computable function whose L^1 -norm is computable is Schnorr equivalent to a difference between two integral tests for Schnorr randomness.

Proof 1

We will show that an integral test f for Schnorr randomness is Schnorr layerwise computable.

Let $f =_{\text{WR}} \sum_n s_n$

where s_n is nonnegative finite rational step functions such that $\|s_n\|_1 \leq 2^{-2n}$.

Then $U_n = \{x \mid s_n(x) > 2^{-n}\}$ is a Schnorr test.

Note that $V_k = \bigcup\{U_n \mid n > k\}$ is also a Schnorr test.

Suppose $x \in X \setminus V_k$. Then $s_n(x) \leq 2^{-n}$ for each $n > k$.

$$f(x) - \sum_{m=1}^n s_m(x) = \sum_{m=n+1}^{\infty} s_m(x) \leq \sum_{m=n+1}^{\infty} 2^{-m} = 2^{-n}$$

for each $n > k$.

Proof 2

Preliminary Layerwise computability Schnorr layerwise computability Discussion

- Suppose that f is a Schnorr layerwise computable function whose L^1 -norm is computable.
- For each point x , construct a approximation of $f(x)$ from below.
- If one finds that $x \in U_n$, then reset $f(x)$ by subtracting a sufficiently large natural number.
- Be sure that each lower semicomputable function has a computable integration.

Refinement

Preliminary Layerwise computability Schnorr layerwise computability Discussion

- (i) The difference btw two integral tests for Sch-rd
 - (ii) The difference btw two layerwise lower semicomp. with comp. integrations
 - (iii) Schnorr layerwise computability with a comp. L^1 -norm
 - (iv) Layerwise computability
- (ii) \Rightarrow (iv) by Hoyrup & Rojas
The equivalence among (i)-(iii) by M.

Schnorr equivalence

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Theorem 12 (Miyabe).

Let f, g be Schnorr layerwise computable functions whose L^1 -norms are computable.

Then f, g are Schnorr equivalent iff $\|f - g\|_1 = 0$.

Discussion

Randomness notions

Preliminary Layerwise computability Schnorr layerwise computability Discussion

The following hierarchy is known:

Schnorr rd. \supsetneq comp. rd. \supsetneq ML-rd. \supsetneq weak 2-rd.

Rd. notion	layerwise ver.
weak 2-rd.	limit layerwise comp.?
ML-rd.	continuous layerwise comp.?
?	layerwise comp.
comp. rd.	computably layerwise comp.?
Schnorr rd.	Schnorr layerwise comp.

Another coincidence

Preliminary Layerwise computability Schnorr layerwise computability Discussion

Definition 13 (Pathak, Rojas, and Simpson). *For an L_1 -computable function $f \in L_1([0, 1]^d)$, define*

$$\hat{f}(x) = \begin{cases} \lim_{n \rightarrow \infty} f_n(x) & \text{if } x \text{ is Schnorr random,} \\ 0 & \text{otherwise} \end{cases}$$

where f_n is a computable approximation of finite rational step functions.

Actually we can show that on a computable metric space the limit of a computable sequence of finite rational step functions is Schnorr equivalent to a Schnorr layerwise computable function and the converse with a condition.

Future works

Preliminary Layerwise computability Schnorr layerwise computability Discussion

- Many results are proved related to layerwise computability. Most of them will be reproved with Schnorr layerwise computability.
- Is it interesting to study Schnorr layerwise lower semicomputability?
- Does there exist a natural function that is layerwise computable but not Schnorr layerwise computable?

Thanks!
